AI RISEN FRAMEWORK ASSIGNMENT 2

Field of Interest:

Computer Information Systems (CIS)

Scenario:

Troubleshooting a slow computer

RISEN Prompt:

Act as an IT support specialist.

Explain how to troubleshoot a slow computer for a beginner.

List step-by-step solutions, including checking storage space, background programs, malware, and system updates.

Use simple language and organize the response in bullet points.

AI Response:

Here are some basic steps to troubleshoot a slow computer:

- **Check storage space:** If your hard drive is almost full, your computer may slow down. Delete unused files or programs to free up space.
- **Close background programs:** Too many open apps can use memory and slow performance. Close programs you are not using.
- **Scan for malware:** Viruses or malware can make a computer run slowly. Use antivirus software to scan your system.
- **Restart the computer:** Restarting clears temporary processes and can improve speed.
- **Check for updates:** Install operating system and software updates to improve performance and security.

- Limit startup **programs**: Too many programs opening when the computer starts can slow it down. Disable unnecessary startup apps.
- Check RAM usage: If memory usage is too high, the computer may lag. Closing programs can help.

ANALYSIS:

This RISEN prompt is effective because it clearly defines the AI's role as an IT support specialist and gives specific instructions on what to include. Also, the response is organized, easy to follow, and relevant to my field of interest in CIS. Using the RISEN framework made the answer more detailed, structured, and useful for a real-world technical situation.

List step-by-step solutions, including checking storage space, background programs, malware, and system updates.
Use simple language and organize the response in bullet points.

Thought for a couple of seconds

Here's a beginner-friendly way to troubleshoot a slow computer.

- **Restart the computer first**
 - A restart clears temporary problems.
 - It can close stuck programs and refresh the system.
 - After restarting, check if the computer feels faster.
- **Check storage space**
 - If the hard drive is almost full, the computer can slow down.
 - On Windows:
 - Open **File Explorer**
 - Click **This PC**
 - Look at how much free space is left on the main drive
 - Try to keep some free space available.
 - Delete files you do not need, or move photos and videos to cloud storage or an external drive.
- **Close background programs**
 - Too many open apps can slow everything down.
 - Even if you do not see them on screen, some programs may still be running.
 - On Windows:
 - Press **Ctrl + Shift + Esc** to open **Task Manager**

- It can close stuck programs and refresh the system.
- After restarting, check if the computer feels faster.

- **Check storage space**
 - If the hard drive is almost full, the computer can slow down.
 - On Windows:
 - Open **File Explorer**
 - Click **This PC**
 - Look at how much free space is left on the main drive
 - Try to keep some free space available.
 - Delete files you do not need, or move photos and videos to cloud storage or an external drive.
- **Close background programs**
 - Too many open apps can slow everything down.
 - Even if you do not see them on screen, some programs may still be running.
 - On Windows:
 - Press **Ctrl + Shift + Esc** to open **Task Manager**
 - Look for apps using a lot of **CPU, Memory, or Disk**
 - Close programs you are not using
 - Be careful not to close important system processes if you are unsure.
- **Check startup programs**
 - Some programs open automatically when the computer starts.
 - Too many startup apps can make the computer slow from the beginning.
 - On Windows:
 - Open **Task Manager**
 - Click the **Startup** tab
 - Disable apps you do not need right away
 - Leave security software enabled unless you know it is safe to disable.
- **Scan for malware or viruses**
 - Malware can make a computer very slow.
 - Run a full scan with your antivirus program.
 - If you use Windows Security:
 - Search for **Windows Security**

Leave security software enabled unless you know it is safe to disable.

- **Scan for malware or viruses**
 - Malware can make a computer very slow.
 - Run a full scan with your antivirus program.
 - If you use Windows Security:
 - Search for Windows Security
 - Open Virus & threat protection
 - Run a scan
 - Remove any threats it finds.
- **Install system updates**
 - Missing updates can cause slow performance or bugs.
 - On Windows:
 - Open Settings
 - Go to Windows Update
 - Check for updates
 - Install available updates and restart the computer if needed.
- **Update important drivers**
 - Drivers help the computer's parts work correctly.
 - Old drivers can cause performance issues.
 - Focus on:
 - Graphics driver
 - Wi-Fi driver
 - Chipset or motherboard driver
 - A beginner-friendly option is to use Windows Update, since it often provides safe driver updates too.
- **Clear temporary files**
 - Temporary files build up over time.
 - Removing them can free space and improve speed.
 - On Windows:
 - Search for Disk Cleanup
 - Select the main drive

too.

- **Clear temporary files**
 - Temporary files build up over time.
 - Removing them can free space and improve speed.
 - On Windows:
 - Search for Disk Cleanup
 - Select the main drive
 - Choose temporary files and other safe items to remove
- **Check your web browser**
 - A slow browser can make the whole computer feel slow.
 - Try:
 - Closing extra tabs
 - Removing unused extensions
 - Clearing browsing data
 - Restarting the browser
- **Check internet speed if only online tasks are slow**
 - If videos buffer or websites load slowly, the problem may be the internet, not the computer.
 - Test another website or app.
 - Restart the router if needed.
- **Look for overheating**
 - If the computer gets very hot, it may slow itself down to protect the hardware.
 - Make sure vents are not blocked.
 - Clean dust carefully if you know how.
 - Keep the laptop on a hard, flat surface.
- **Free up memory by using fewer apps at once**
 - If you open many apps together, the computer may run out of RAM.
 - Try using fewer programs at one time.
 - This is especially important on older or lower-end computers.
- **Check the type of storage drive**
 - Computers with an SSD are usually much faster than ones with an older HDD.
 - If the computer is old and always slow, upgrading from HDD to SSD can make a big difference.

ChatGPT

- If you open many apps together, the computer may run out of RAM.
- Try using fewer programs at one time.
- This is especially important on older or lower-end computers.
- **Check the type of storage drive**
 - Computers with an **SSD** are usually much faster than ones with an older **HDD**.
 - If the computer is old and always slow, upgrading from HDD to SSD can make a big difference.
- **Know when hardware may be the issue**
 - If the computer is still slow after all these steps, the issue may be:
 - Not enough RAM
 - Old hard drive
 - Aging computer hardware
 - In that case, an upgrade or repair may help more than software fixes.
- **Simple troubleshooting order to follow**
 - Restart the computer
 - Check free storage space
 - Close background apps
 - Disable unnecessary startup apps
 - Scan for malware
 - Install updates
 - Clear temporary files
 - Check for overheating
 - Consider hardware limits
- **When to get extra help**
 - Get help if:
 - The computer freezes often
 - It makes strange noises
 - It shuts down by itself
 - It stays very slow even after basic troubleshooting

If you want, I can turn this into a shorter discussion-t style answer too.
