1. Project Overview

Bronx Youth Boxing Academy (BYBA) is a community-focused boxing gym website designed to provide information about training programs and allow users to register online. The website will serve as both an informational platform and a functional membership system.

The project will integrate HTML, CSS, PHP, and MySQL to create a working system where users can submit registration and contact forms, and the submitted data will be stored in a database.

This project demonstrates practical use of web development concepts including form handling, server-side scripting, and database interaction.

2. Purpose & Target Audience

Target Audience:

- Youth interested in boxing training
- Parents seeking structured athletic programs
- Adults looking for fitness and self-defense training
- Community members seeking organized recreational activities

Problem Being Addressed:

Many local gyms rely on paper registration or phone calls to manage memberships. This leads to disorganization, lost information, and inefficient record keeping.

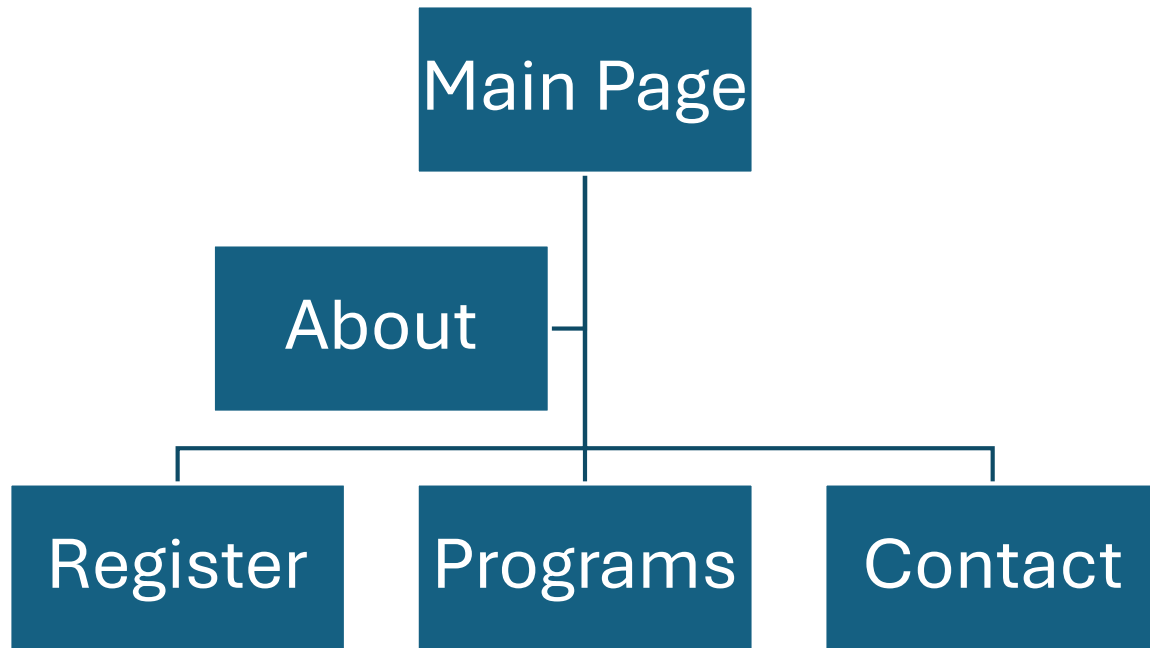

This website provides:

- Online registration
- Organized digital records
- Easy communication through contact forms

Real-World Application:

A real boxing gym could use this system to collect membership information, manage program signups, and store contact inquiries securely in a database.

3. Website Structure (Site Model)

4. Page Descriptions

Home Page

- Gym name and branding
- Mission statement
- Call-to-action buttons (Register / View Programs)
- Featured programs or highlights

About Page

- History of the gym
- Overview of coaches
- Community mission and youth development focus

Programs Page

- Youth Boxing Program
- Adult Fitness Program
- Basic training schedule
- Membership pricing overview

Register Page (PHP + MySQL Integration)

- Form fields:
 - Full Name
 - Age
 - Email
 - Phone Number
 - Program Selection
- Upon submission:
 - Data is processed using PHP
 - Information is inserted into MySQL database
 - Confirmation message is displayed

Contact Page (PHP + MySQL Integration)

- Name
 - Email
 - Message
 - Data will be stored in database for gym review
 - Confirmation message displayed after submission
-

5. Technical Requirements

This website will use:

- HTML (structure)
- CSS (design and layout)

- PHP (server-side scripting)
- MySQL (database storage)

The database will include tables such as:

- members (stores registration data)
- contact messages (stores contact form submissions)

PHP scripts will:

- Validate form input
 - Insert data into database
 - Display confirmation responses
-

6. Design Concept

The website will feature:

- Athletic, modern design
- Clean navigation bar at top
- Black, white, and red color scheme
- Boxing-related imagery
- Clear section spacing for readability

The layout will be simple, professional, and easy to navigate.

7. Measuring Success

The website will be considered successful when:

- All pages load correctly
- Navigation links function properly
- Forms submit without errors
- Data is successfully stored in the database
- Users receive confirmation messages

Success will be measured by testing database entries and confirming proper PHP processing.
